

The demand for higher walls has led to the Plumwall Commercial System. The Plumwall Commercial System is a modular system designed to brace ICF walls up to 24' in height and is fully adjustable. This system is comprised of three main components that are combined and stackable to give support to 8', 16' and 24' walls. The **ladder** is the strongback and comes in 8' modules. The **outer brace** is used to extend that base when the ladder modules are stacked. The **platform** allows workers to have a work platform that can be installed in 12" increments. Appropriate safety railings can be built to comply with local codes at any level.

The contractor is able to continue supporting additional wall heights with the Plumwall Commercial System without having to remove any components. For example, you can build the first 8' section of wall, align it, pour it and then add additional modules to extend the wall up to 24' in height. Conversely, you can build the entire height (up to 24') and pour through the windows in the wall, since the platforms and safety railings can be placed anywhere and even in multiples along the height of the wall.

Components are electro-plated for corrosion resistance.

This system is *not* compatible with the Original or Econo Bracing Systems.
