

The Plumwall Original Brace comes in a standard 10' length, is lightweight (only 54 lbs) and is still the favorite of many builders due to the all-in-one feature of the brace. The brace is best utilized for repetitive jobs where the wall heights are smaller. All components are bolted or pinned in place with the telescopic diagonal brace adjustable in 3" increments. The brace folds up to a compact size for easy transportation and then unfolds with all components attached – nothing gets left behind. There are slots in the back of the strongback so you can secure the brace directly to the block or use the block straps (which are included) for additional strength.

The optional ground screw can be used in appropriate soil conditions for quick installation. Steel or wood stakes, screws or nails can also be used to secure the brace to the sub-floor. The diagonal foot has a full swivel base that can be fastened at any angle.

Alignment can be done by one person from either the platform or from the ground. A railing pocket allows for different styles of safety railings to be built to comply with local codes. The adjustment system is enclosed to protect it from concrete spillage.

The Plumwall Original brace is available in 8', 9' and 12' by special order. Please call for delivery.
